TASK:

First of all it was very difficult to initially find the http site as almost all websites are https now adays. However, after searching I found one the site which can be seen in above screenshot, which I connected through telnet. After connecting to it I gave it a get command as written below:

GET/HTTP/1.1

Host: checkup.dyndns.org

This instruction does not show up on console and remains invisible however, after writing this and pressing enter the request was accepted and outcome was set of some lines including the html page of the website page we requested to get, for reference I have attached the screenshot of console and website page we requested through GET command below.

Console :

Website page that we requested through get command:

Through this we realized that get command is to request some specific page's html file. If we had to go to some specific page we would write it before HTTP in GET/HTTP/1.1.
